Neoprene Cladding Systems

APS’s Coatings & Linings Division provides application of factory and site based specialist coatings and linings to the oil, gas, water and power industries.

The highly vulnerable splash zone area with its continuous exposure to oxygenated seawater and wave action can easily strip conventional coatings from the surface of the steel, allowing high levels of corrosion to occur. Neoprene cladding system is a tough elastomeric coating, designed to withstand the adverse environmental conditions affecting structural splash zones and marine risers.

**Features**
- Extreme Corrosion Resistance
- Excellent Abrasion and Impact Resistance
- Extremely Durable
- Ideal for Splash Zone Area Protection

**Applications**
- Splash Zone Area Riser Pipes
- Splash Zone Area Jacket Legs
- Splash Zone Rea Riser Clamps
- Splash Zone Area Riser Conductors / J-Tubes
- Field Joints / Sectional Repair
Installation Guidance

Neoprene Cladding Systems are applied on a well prepared surface and installed by a qualified crew, using the right equipment. After application of an epoxy primer and a bonding agent the neoprene rubber is hand applied and vulcanized employing the most modern steam autoclaves. The system thickness ranges from 12.5mm to 25mm depending on the exposure conditions and specification.

APS is proud of its extensive track record of protecting several thousand risers in all parts of the world so far.

APS brings unrivalled levels of innovation, experience and expertise in corrosion engineering and contracting. We have in-depth knowledge of the industry, our customers’ day-to-day challenges and the environmental, health and safety standards in the marketplace. By working in close partnership with our customers, our company is able to provide timely, efficient, cost-effective and above all quality products and services.
